

I have coded all the requirement of the lab including the improve part. But there is something wrong that I cannot make it work. I consulted the TA on Wednesday Morning, October 7, 2015 and added some System out print sentence to check where and what was wrong, finding that my insertion only executed one time and the program was trapped in a dead loop. However, the TA I consulted and myself both considered my code is logically correct since I have set terminated criteria for each loop . So... I am confused. I know I cannot get a good grade this time but just tell me what the bug is. Thank you very much!
